COVER: Collagen content evaluated by sirius red staining in the tunica media (M) of sc small resistance arteries in a normotensive control subject, essential hypertension patient, and patient with primary aldosteronism (*upper panels, left to right*); and their respective relative proportions of type I (*orange/red*) and type III collagen (*yellow/green*). Total collagen and type III vascular collagen were significantly greater in primary aldosteronism than in essential hypertension; and both hypertensive patient populations had more total and type III vascular collagen than normotensive controls.
